

# Lesson 13-1 "Complementary, Supplementary, & Adjacent Angles" p. 137

LT: Write equations involving (those)

Vocab:

adjacent angle

share side/vertex

Qs

- 1) Complement  
Step 1: Write equation to  $= 90^\circ$   
2: Inverse operation

As

$$\begin{array}{r} 81 + n = 90 \\ -81 \quad | -81 \\ \hline n = 9 \end{array}$$

- 2) Supplement  
same but  $= 180^\circ$

$$\begin{array}{r} n + 147 = 180 \\ -147 \quad | -147 \\ \hline n = 33 \end{array}$$

ex)  $\angle JKL$  &  $\angle RST$  are complementary  $= 90^\circ$   
 $m\angle JKL = 36^\circ$  &  $m\angle RST = (x + 15)^\circ$

- ① What's  $x$ ?
- ② What's  $m\angle RST$ ?

$$\frac{36}{\angle JKL} + \frac{(x + 15)}{\angle RST} = \frac{90}{= \text{comp.}}$$

$$\begin{array}{r} 36 \\ + 15 \\ \hline 51 \end{array}$$

$$\begin{array}{r} 36 + x + 15 = 90 \\ \hline 51 + x = 90 \\ -51 \quad | -51 \\ \hline x = 39 \end{array}$$

- ① combine like terms
- ② inverse op.

①  $x = 39$

②  $m\angle RST = (x + 15)^\circ$   
 $39 + 15 = 54^\circ$

# L13-2 "Vertical Angles & Angle Relationships in Triangle"

P. 142

LT: Sum of  $\angle$ s in  $\Delta$ .

Vocab: Vertical Angles  $\rightarrow =$

conjecture

- $\rightarrow$  statement seems true
- $\rightarrow$  not proven T/F

Protractor  $\rightarrow$  tool used to measure  $\angle$ s

Triangle  $\rightarrow$  3 line segments meet at endpoints  
 $\rightarrow$  sum of  $\angle$ s =  $180^\circ$

Qs

- Vertical  $\angle$ s  
 $\angle 1 \cong \angle 3$   
 $\angle 2 \cong \angle 4$

As

ex)

- Find missing  $\angle$ s

$\angle 1 \cong \angle 2 = 180^\circ$   
 $\angle 4 \cong \angle 3$  straight  $\angle$

ex)  $m\angle 3 = ?$

$$\begin{array}{r}
 \angle 4 + \angle 3 = 180^\circ \\
 \downarrow \quad \downarrow \\
 70 + n = 180 \\
 -70 \quad \downarrow \quad -70 \\
 \boxed{n = 110^\circ} \leftarrow m\angle 3
 \end{array}$$

ex)  $m\angle 2 = ?$

$\angle 4 \cong \angle 2$  are vertical  $\cong =$   
 so since  $\angle 4$  is  $70^\circ$   
 $\angle 2 = 70^\circ$  too!

ex) since  $m\angle 3 = 110^\circ$   
 $m\angle 1 = 110^\circ$

L13-2 pgs 2

↓ They're = since they're vertical

$$(3x)^\circ = 51^\circ$$

$$\frac{3x = 51}{3 \quad | \quad 3} \\ \hline x = 17$$

Find x?

Isolate variable

$$\begin{array}{r} 17 \\ 3 \overline{) 51} \\ \underline{-30} \\ 21 \end{array}$$

③ Triangles

↳ sum of all 3  $\angle$ s  
+ =  $180^\circ$

find  $x^\circ = \boxed{\phantom{00}}$

$$50 + 50 + x = 180^\circ$$

$$100 + x = 180^\circ$$

$$\begin{array}{r} -100 \quad +100 \\ \hline x = 80^\circ \end{array}$$

Step 1: add all to =  $180^\circ$   
2: solve for x

Find x?

measure of each  $\angle$ ?  
 $m\angle D = ?$   
 $m\angle E = ?$   
 $m\angle F = ?$

$$\frac{(2x+2)^\circ}{F} + \frac{(x+10)^\circ}{E} + \frac{x^\circ}{D} = 180^\circ$$

$$\underline{2x+2} + \underline{x+10} + \underline{x} = 180^\circ$$

$$\underline{2x+x+x} + \underline{2+10} = 180^\circ$$

$$4x + 12 = 180^\circ$$

$$\downarrow \quad -12 \quad | \quad -12$$

$$\frac{4x = 168}{4 \quad | \quad 4}$$

$$\boxed{x = 42}$$

$m\angle F =$

$$(2x+2)$$

$$2(42) + 2$$

$$84 + 2 = \boxed{86^\circ}$$

$m\angle E =$

$$(x+10)^\circ$$

$$42 + 10 = \boxed{52^\circ}$$

combine like terms  $\rightarrow$

$$m\angle D = 42^\circ$$

$$m\angle E = 52^\circ$$

$$m\angle F = 86^\circ$$

$\rightarrow$  now plug in to find rest.

# L14-1 Draw Triangle from Side Lengths p. 147

LT: Decide if 3 sides lengths determine a  $\Delta$ .  
Draw  $\Delta$  w/ given sides.

Vocab: unique  $\Delta$   
↳ only one way to draw that  $\Delta$

Do pg. 147

# 16  
1st Qs

① Does it make a  $\Delta$ ?

↳ sum of 2 shorter sides  
+ have to be  $>$  than  
longest side.

Step 1: circle largest side

2: add other 2  
to compare

As

ex)  $(7, 5, 2) = \Delta?$

$$5 + 2 > 7$$

$$7 > 7 = \text{NO!}$$

ex)  $3, 4, (6)$

$$3 + 4 > 6$$

$$7 > 6 ! \text{yes}$$
